

GoWater Vendo — GCash Payment Detection

How the vending machine confirms a GCash payment automatically — and how the same GoWater server also powers the HR Portal and the mobile app.

Why the exact centavos

The QR on the machine is a fixed GoWater QR, so every payment looks the same to GCash. Each sale therefore gets its own amount — ₱20.07, ₱20.13, ₱20.24 — and the machine only dispenses when *that exact amount* arrives. Two people paying ₱20 at the same moment can never trigger the wrong machine.

What the customer sees

Pick product → scan QR → type the shown amount → water in a few seconds. No app, no receipt to show, no staff.

Why it needs a server

GCash gives businesses no official connection that could tell a machine "you were paid". The only place a payment is visible is the merchant dashboard. The Payment Watcher checks it automatically — which needs a computer that is **always on, always online, never sleeping**. The vendo chip is too small for that, and an office PC sleeps or gets used.

One server, three jobs

- Payment Watcher** — confirms GCash payments for every vendo machine.
- Database** — the single source of truth: sales and payments from the machines, plus staff, attendance, leads, units and service reports.
- Backend for the apps** — the **GoWater HR Portal** (web) and the **GoWater Mobile App** read and write this database, so a sale on a machine, an attendance check-in on a phone and a report on the portal all land in the same place, instantly.

Keeping the database on a GoWater-owned server (instead of a pay-per-project cloud database) means one fixed monthly cost no matter how many machines, users or apps are added, full ownership of the data, and daily backups under GoWater's control.

Server: one cloud server (Hetzner or Vultr), roughly 4 vCPU / 8 GB RAM / 160 GB storage with daily backups — **about ₱1,600 / month**. Under a GoWater account, GoWater owns the data. Handles all vendo machines, the HR Portal and the mobile app; adding machines or users adds no cost.

Notes: payment matching depends on how quickly GCash shows a payment in the dashboard — to be confirmed with a live ₱1 test before rollout. The GCash login on the Watcher expires from time to time; when it does, GoWater gets a message and someone logs in again (a 1-minute task).
